CCRQInvoice is a QuickBooks Compatible application that will work closely with your QuickBooks data files to modify how values are presented and calculated in your order forms.

ORDER TOTALS

Many businesses need a total weight or total quantity shipped on an invoice, which QuickBooks cannot provide. CCRQInvoice allows you to easily add these totals.

QUANTITY / RATE CALCULATIONS

The standard method used in QuickBooks to calculate the *amount* in a detail line is *Quantity X Rate = Amount*. With CCRQInvoice you can modify this to calculate the quantity or rate based on the values of other columns in the invoice.

Many businesses want their sales orders or invoices sorted so that the items can easily be located when picked for shipping. CCRQInvoice allows you to sort the details of an order by item, description, date or any custom field.

ORDER TEMPLATES

QuickBooks provides a simple to use page-oriented “template” system that you can use to customize the printed forms to fit your needs. However, this “page-oriented” approach has limitations. Each page of your invoice must have the same format and contain the same information. This means that a “total” box, as well as address and header information, must appear on every page of a multiple page invoice.

CCRQInvoice provides an alternative approach, with a report-oriented form editor that allows you to define a different format for the first and last pages of an invoice. Now you can create invoice (as well as estimate and sales order) forms that look professional and fit the needs of your business.
